Action following the last six extremes in the Silver/ Gold Ratio: Rebound highs in silver occur in 15 to 18 weeks, generally on a retest or failed breakout of the upper 7% moving average envelope. The August 26th breakout occurred at week 17, and was followed by a failure. Silver should give back 62% or more of the advance from the June low (*targeting$37.60*).

The following six charts display the action around extremes in the silver/gold ratio

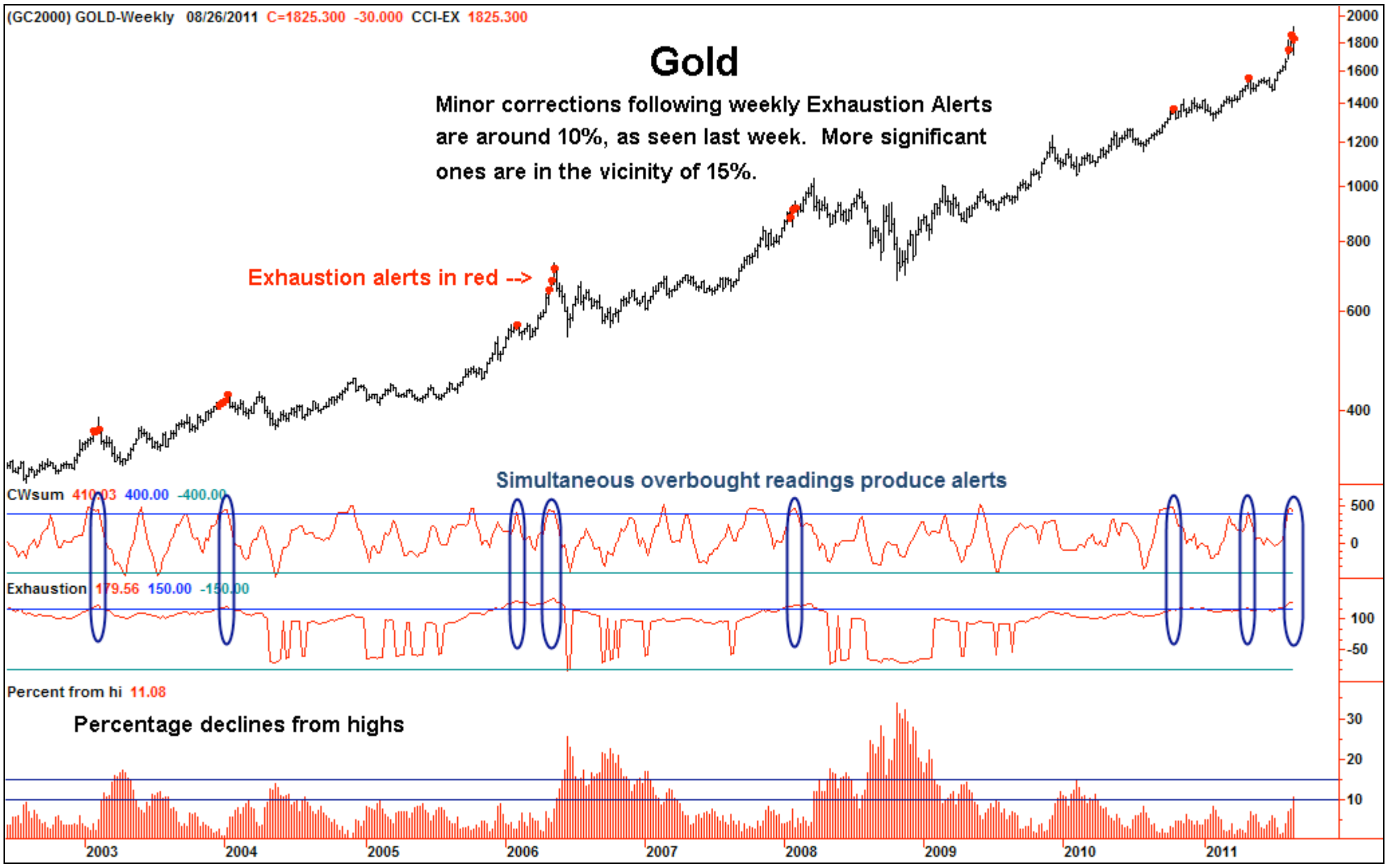
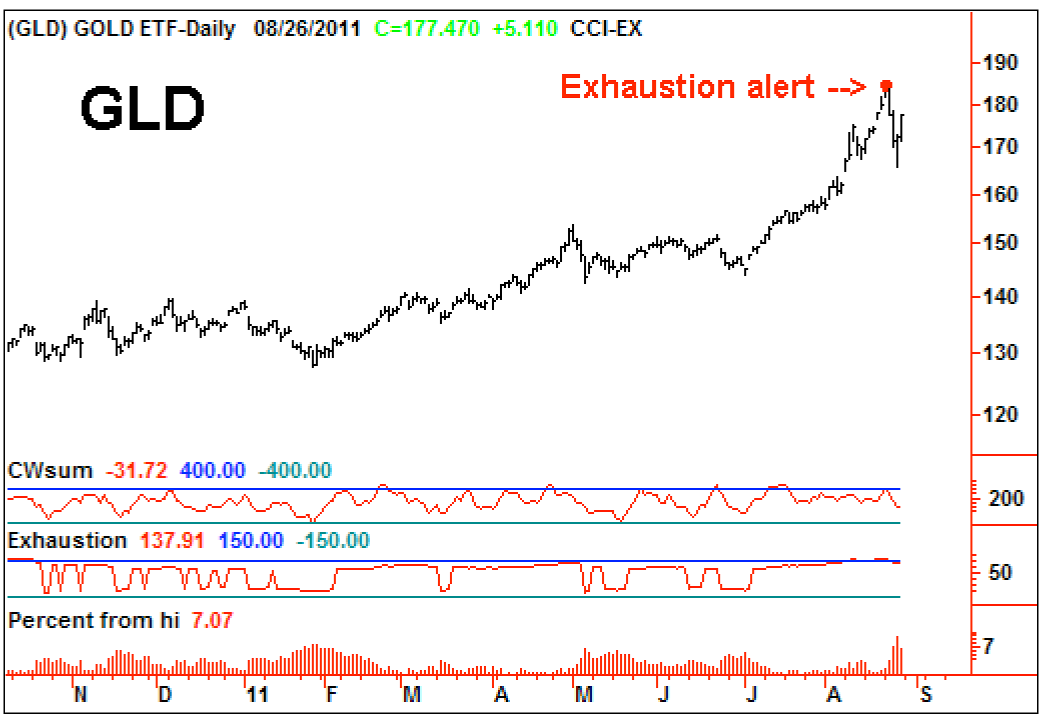
Exhaustion Alerts





Our Springboard signal is designed to find the bottom of short lived corrections within rising trends and has done an excellent job in gold. The most recent signal was at $1500 in late June.

Consequences of corrections following July breakouts: Daily Springboards were identified at the lows of August 27, 1971, August 24, 1978 and August 6, 1979. Daily signals did not occur in 1972 and 1993, but weekly signals were present on the two important bottom weeks in 1972 (November 10th & 17th) and three of the four bottom weeks in 1993 (August 27, September 10th & 17th).

We will be watching closely for new signals.

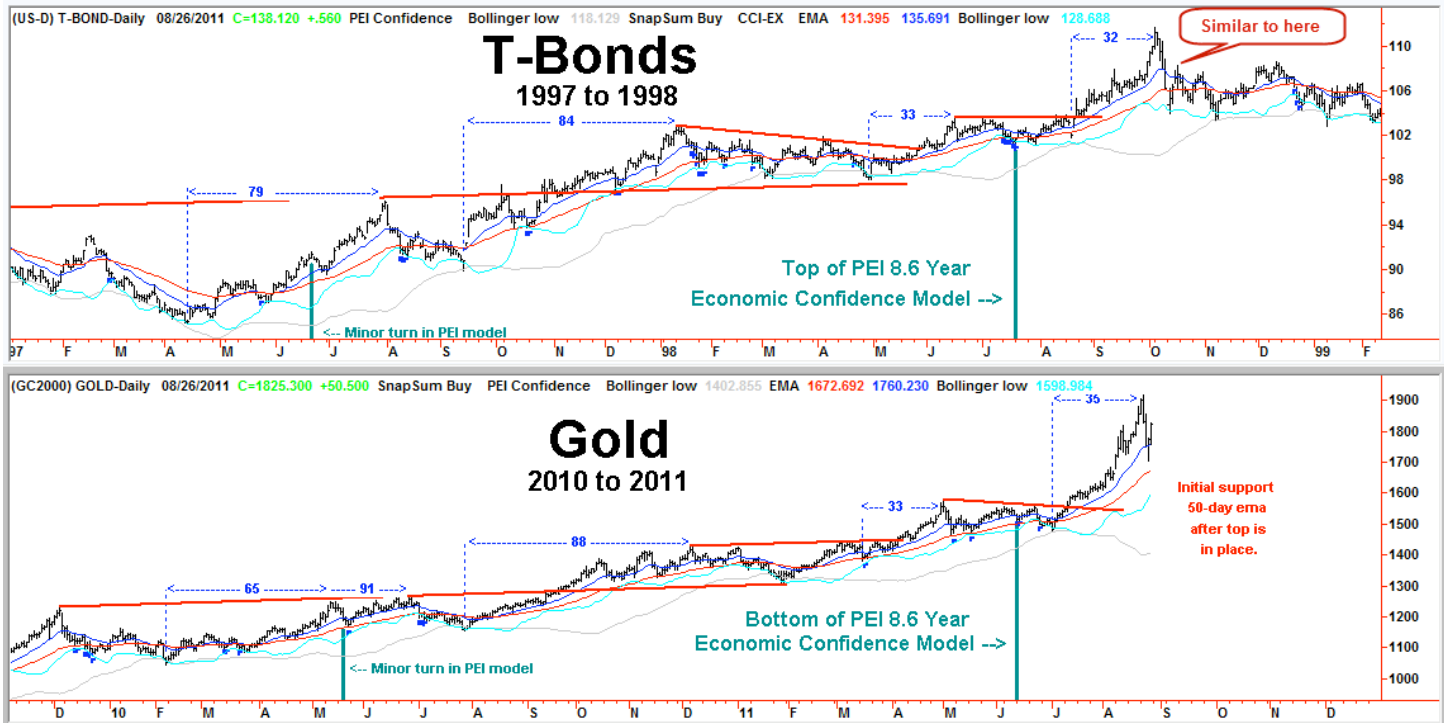
July's that made new highs for the year

The seasonal pattern in gold is for strength from early August through early October, influenced by the Indian wedding season. However, the seasonal has been running six weeks early. Based upon this shift in pattern we should look for a six week consolidation/correction before the next advance.

Gold – Another Reason to be Looking for an August High

A July interview by Ben Davies regarding the strength in gold this summer, having a similar smell to bonds in 1998, when everyone was on holiday, brought back memories for us. The 1998 peak in bonds occurred two months following the top of the PEI 8.6 year Economic Confidence Model. Our reports at the time recommended sales into the first week of October, calling for an initial break of 12 points and outside possibility of 17 points. By December 1999 the decline had been 22 points.

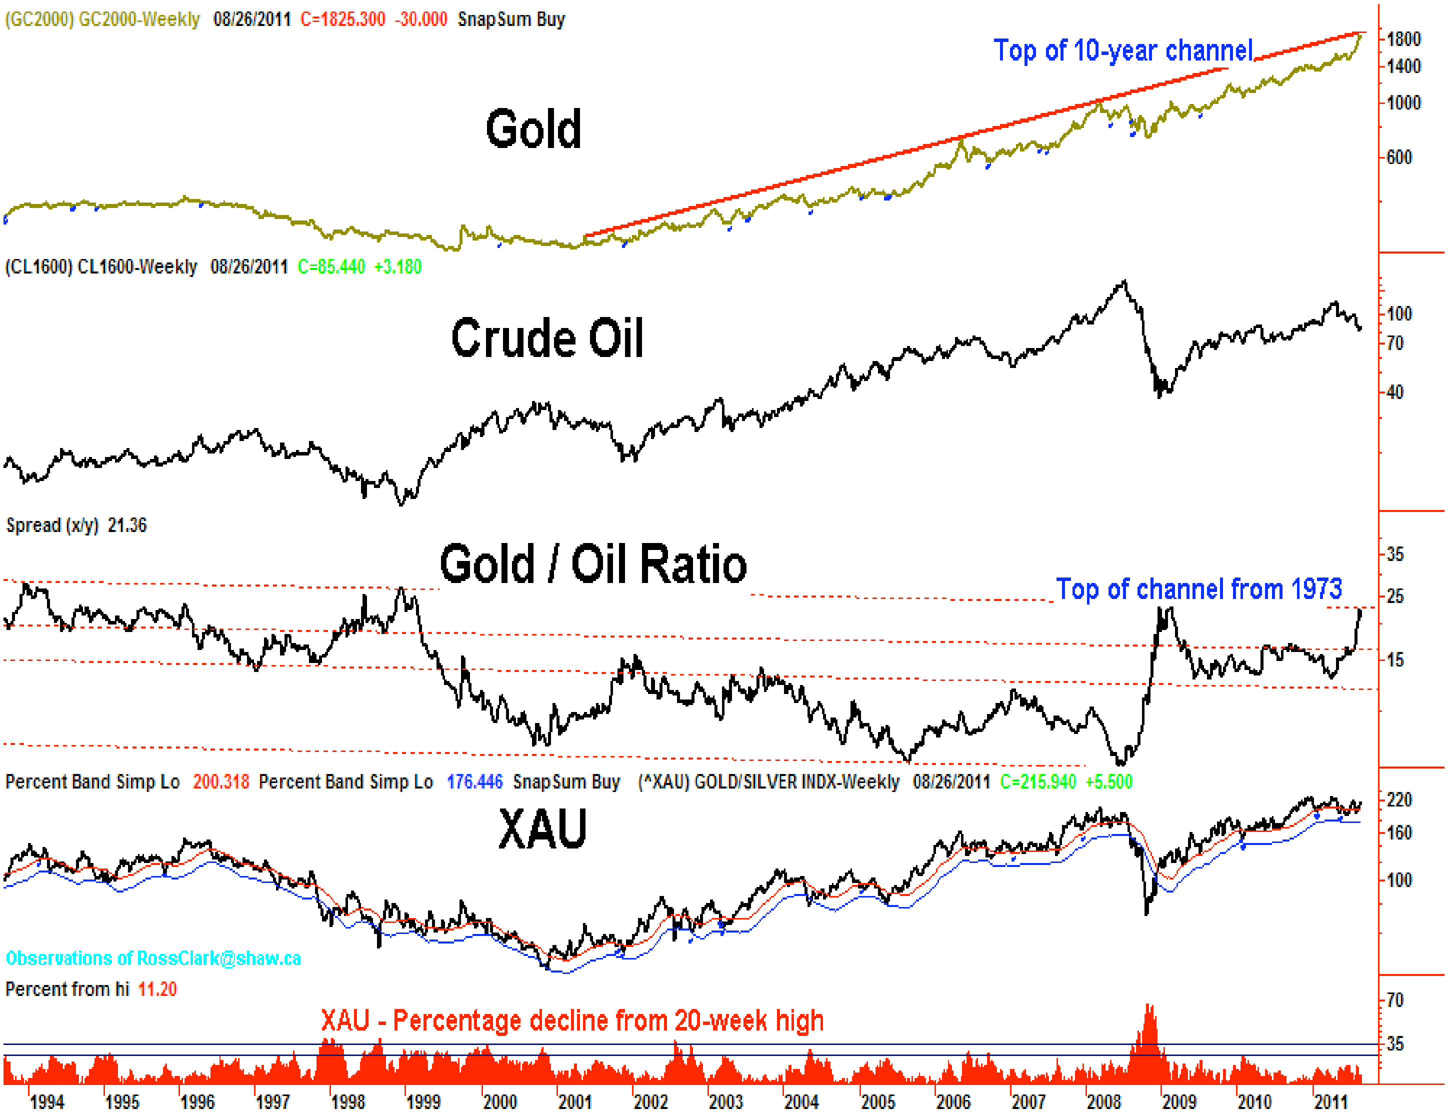
Relationship with PEI T-Bond model from 1998



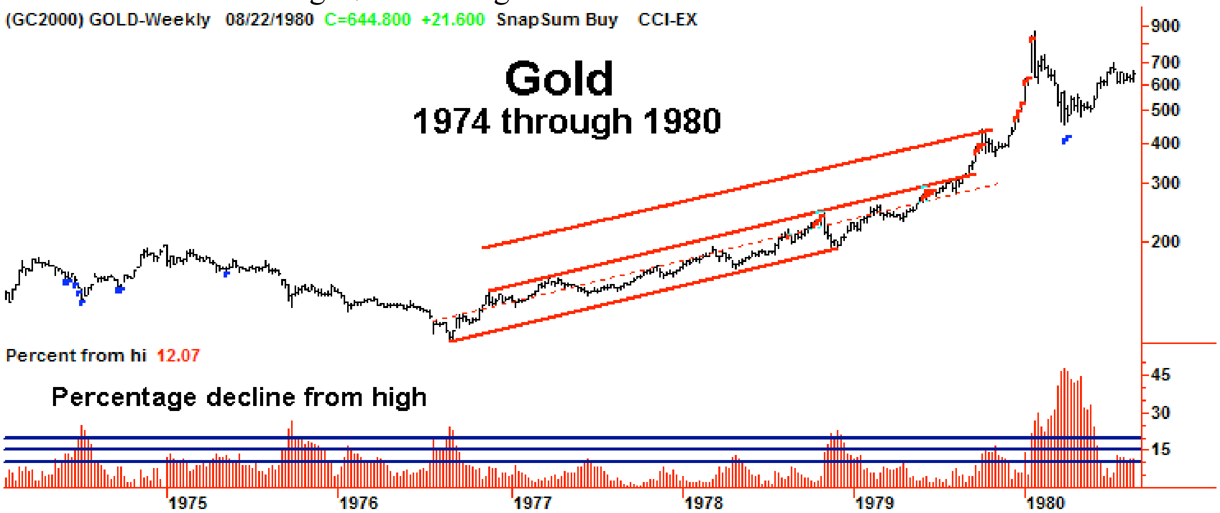
It is now thirteen years later and the 8.6 year cycle has just passed its low point (June 13th) in the next cycle. The price action of the two markets has remarkable similarities. The series of consolidations, pullbacks to breakouts, moving average supports and tests of Bollinger Bands show a high correlation. Our Springboard buy signals (blue crosses) are also well timed on both charts.

The length of time in the various rallies (blue labels) is uncanny. The rally into May 2nd matched perfectly with the thirty-two day bond rally into June 16, 1998. **The current rally in gold should have topped around August 17th**. It was only 3 ½ days late. As previously noted, a test of the 50-day ema (*currently 1561*) is then expected, with a distinct chance of a test of the breakout line round $1550. The optimum low using the correlation with the T–Bond chart should occur on a kiss of the lower 21-day Bollinger Band (light blue) and possibly the 55-day Bollinger Band (grey) if the consolidation lasts for a month or more.

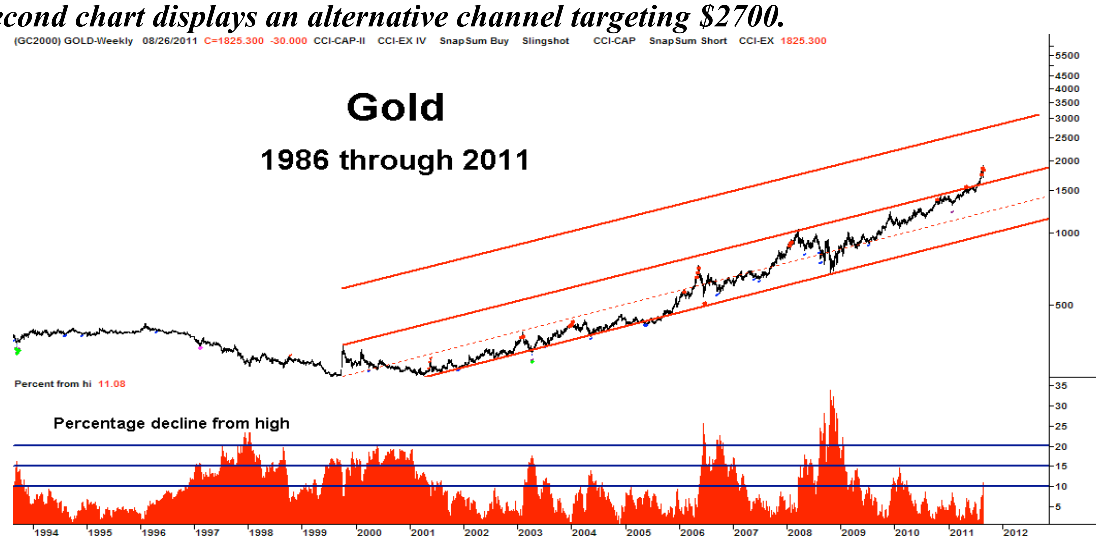
The gold/oil ratio is into resistance around 22:1. Look for the mining stocks to have a 20%+ decline into an attractive buying opportunity in the coming one to three months.



The decade long bull market is taking 3 ½ times longer to evolve as the bull market of 1976 to 1980. A pause here for a number of weeks followed by decisive close through $1900 would take gold out of the methodical uptrend channel and place it into an exponential phase targeting $2900+. This would be similar to the breakout through $310 in August 1979.

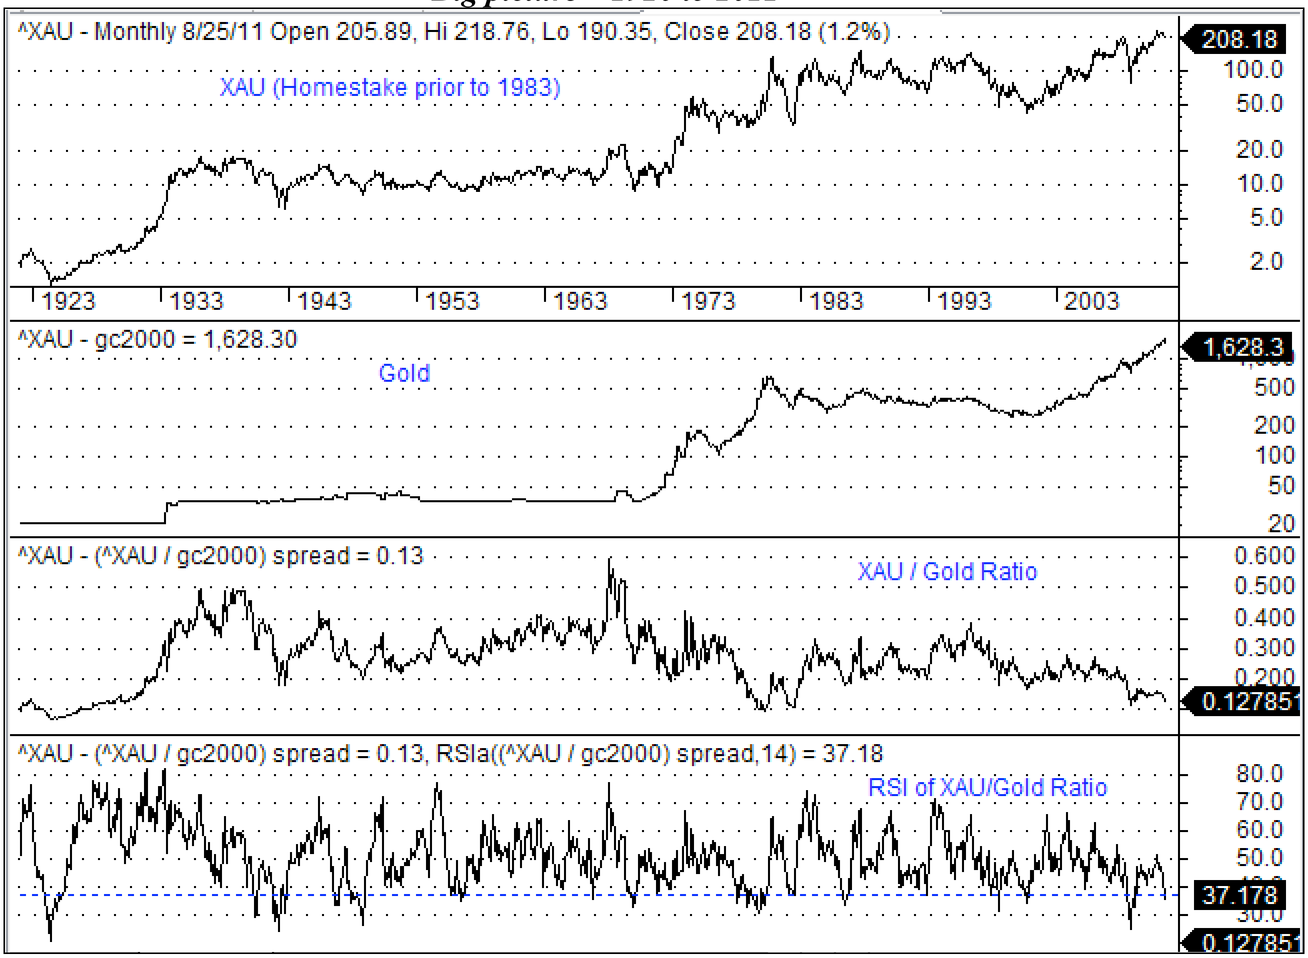


The second chart displays an alternative channel targeting $2700.

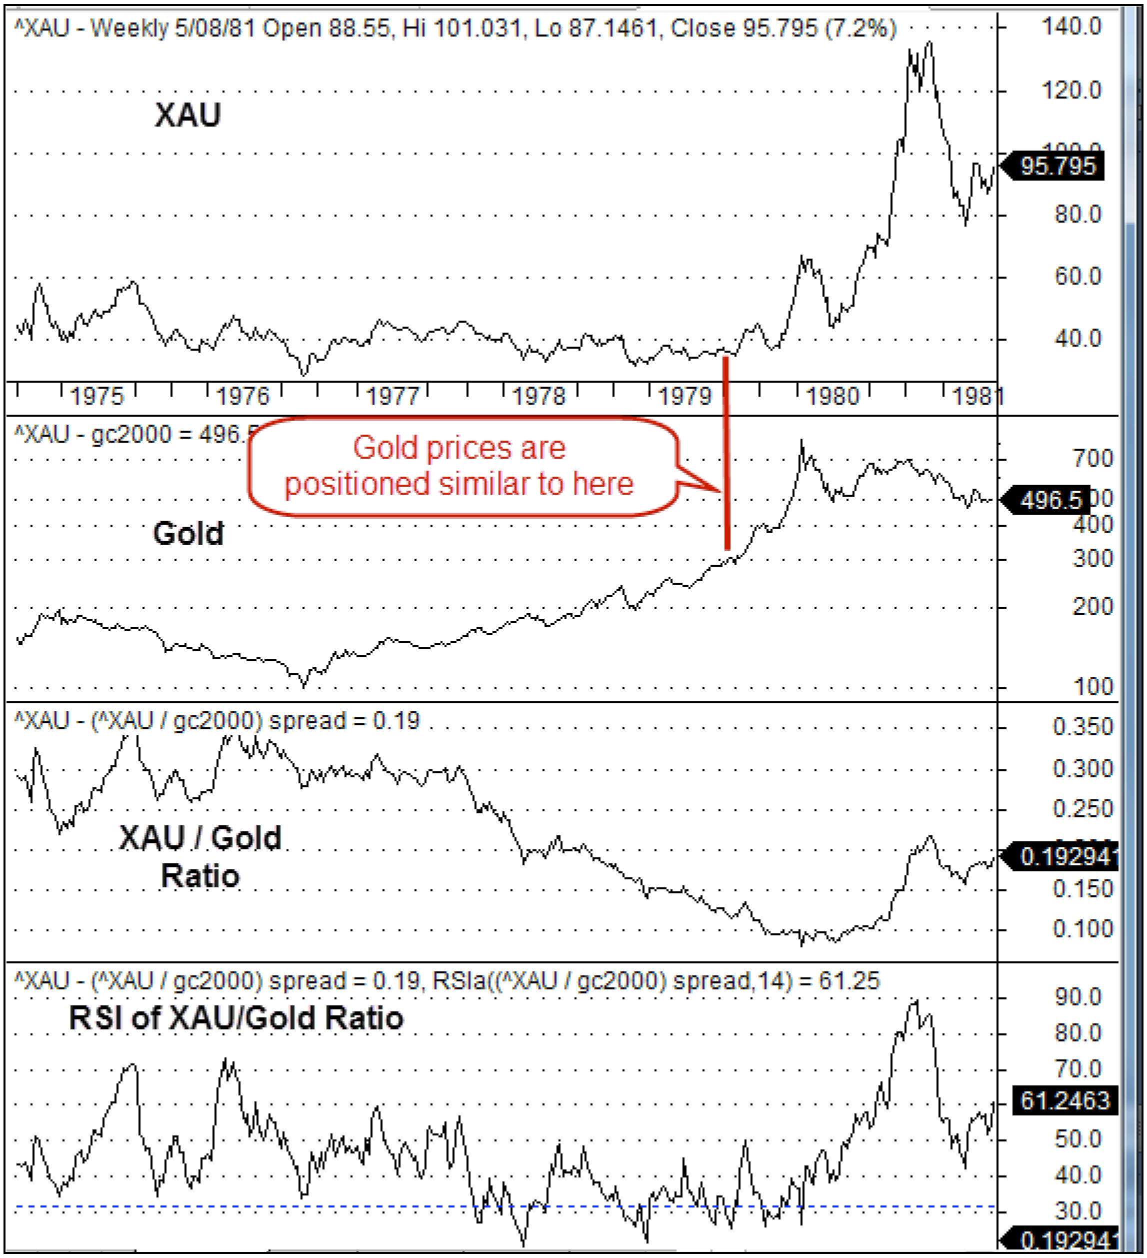


Mining stocks have under performed bullion for a number of years and the current ratio of XAU/Gold is close to the lows of the past three decades. This is similar to the bull markets of 1971 to 1975 ($35 to $200 in bullion) and 1976 to 1980 ($100 to $850 in bullion). When the monthly RSI drops below 38, as it did in July, it generally takes one to three months for the XAU to complete a base from which to advance.

Big picture – 1920 to 2011



If gold is positioned similar to July-August 1979 then we can anticipate a consolidation to be followed by a good participation in the mining stocks on the next move in gold.



Gold is still not expensive when related to the broad equity markets. The secular bear in equities started in 2000. Look for it to continue, with the Dow/Gold ratio (*currently 6.1:1*) eventually finding its bottom no higher than 5:1, but easily capable of moving to test the 1974 low of 3.3:1, the 1932 low of 2:1 or even the 1979 low of 1.5:1.
